Ph.D. Research Overview

– *We aim to pave the way to a reliable Open-world Machine Learning system.*

Out-of-distribution (OOD) Detection: In an open-world, training and testing distribution for deep neural networks can be different. We want to build robust machine learning system that can identify OOD samples in inference time.

Open-world Representation Learning: As an additional step for detecting OOD, we want the model to learn OOD samples from the novel classes. Under the setting, the model should ideally learn distinguishable representations—not only for the known classes but also the novel categories.

Interpretability: Build an interpretable machine learning system, particularly in visualizing and quantitating the model's inference mechanism or constructing one inherently sparse, simulatable, modular, and thus, interpretable.
